Compliance & Transparency
– Gas (CTG)

Compliance & Transparency – Gas (CTG)

CTG is a Bulk Calculations Solution (BCS) product. Fully integrated with the SAP Oil&Gas business function set, CTG enables simple-to-deliver transparency and GRC framework application to the bottom-line of your business - bulk goods quantity conversion management. CTG provides unique, centralised, management and control possibilities for all current QCI-compatible gas quantity calculations being used within your SAP Oil&Gas solution. Fundamental CTG value factors are:

Transparency:

CTG provides immediate clarity and precise definition. Via the QuantityWare Gas Measurement Cockpit (GMC), view and prove the definition of your business' fundamental values, satisfying customers, regulatory bodies and internal control instances. Your business is bulk materials movements, without full transparency and reliability, other GRC efforts are without foundation.

GRC:

Support Governance efforts by delivering specific information to senior management.
Risk definition and assessment in the area of product measurements is only possible with complete transparency and the ability to access, document and evaluate all factors.

Compliance must be defined, managed and enforced – use the CTG framework to enable such activities in your business systems.

Due Diligence:

Business success, security and integrity are a primary organisational responsibility. Vast quantities of data are received from "the field" regarding material volumes, energy equivalents etc. With CTG, assess the accuracy of such data and provide your business with a "check and balance" – explain the numbers and ensure due diligence in your business activities.

Reduced Expenditure, Increased Flexibility:

Business times are turbulent; plan ahead by leveraging CTG to execute theoretical, non-productive calculations in any supported standard.

Proven Quality:

With over seven years of productive usage on several SAP release levels, CTG leverages proven QuantityWare technology.

Solution Service and Support:

All customer issues are important, thus we offer a comprehensive maintenance and support service portal. Through certified consultants we offer our customers implementation support and consulting security around the globe.

Holistic Solution:

The field of quantity calculations is as dynamic and complex as the demands of your business. A "single piece of software" cannot effectively address such complexity, thus we have integrated our software products into a holistic solution – BCS, consisting of: SAP ABAP-based software functionality, our Project Assessment and

Implementation Guidelines (PAIG), expert maintenance, support and development, full documentation, plus training and working papers addressing current and frequently-queried topics.

Technical Quality:

Supporting all QCI-compatible calculations, as a part of the SAP-certified BCS, CTG runs exclusively on the ABAP-stack. Using SAP-defined technical packages, technical handling is a familiar task for basis groups. QuantityWare BCS uses an SAP-defined object name-range and is non-modifying. Extensive testing and technical procedures guarantee software quality. CTG customizing and configuration use standard SAP transport methods, ensuring adherence to existing quality and security policies. If necessary, CTG corrections are provided via CTS transports, allowing efficient issue resolution.
