

Note: 000079

Overview

Number	000079
Description	Business Document Analysis - Automatically Generated Lines
Version	1 from 05.11.2018
Status	Released to Customer
Language	EN
Responsible	Markus Seng
Product	BCS
Category	Correction - SAP Integration

Symptom

You utilize the business document analysis (accessible via the PMC of GMC) and analyze material documents for your bulk products.

For automatically generated material document items (one-step transfer postings, material re-brand postings) created, e.g. by TD shipments, the analysis results are not consistent with other material document items that are also automatically generated. In general, the analysis data for such material document items are hard to understand.

Cause

- Generated line items do not carry MSEGO1 data - since that data is only relevant for the parent lines (e.g. issuing plants or source materials for re-branding).
 - TD shipments post material documents where MSEGO1 data is cleared, also for non-automatically generated MSEG line items.
-

Solution

The business document analysis logic is changed so that all automatically generated lines (as well as lines where MSEGO1 data has been deleted) are not passed through the complete analysis algorithms.

Such lines are displayed with an information message and the copied quantity data has to be compared visually by users with the parent lines.

Transport Reference
